A REVIEW ON CHROMATOGRAPHIC AND SPECTROPHOTOMETRIC METHODS FOR ESTIMATION OF GLIFLOZIN IN BULK AND IN DIFFERENT DOSAGE FORMS

INTRODUCTION:
Gliflozin drugs are a class of pharmaceuticals that inhibit renal glucose reabsorption and therefore lower blood glucose. They act by inhibiting sodium-glucose transport protein 2 (SGLT2), and are therefore also called SGLT2 inhibitors. Gliflozin used in the treatment of type II diabetes. As studied on canagliflozin, a member of this class, Gliflozin enhance glycemic control as well as reduce body weight and systolic and diastolic blood pressure [1].

SGLTs are responsible for mediating glucose reabsorption in the kidneys, as well as in the gut and the heart. SGLT-2 is primarily expressed in the kidney on the epithelial cells lining the S1 segment of the proximal convoluted tubule. It is the major transport protein that promotes reabsorption from the glomerular filtration glucose back into circulation and is responsible for approximately 90% of renal glucose reabsorption. By inhibiting SGLT-2 it prevents renal reuptake from the glomerular filtrate and subsequently lowers the glucose level in the blood and promotes glucosuria [2,3].

ABSTRACT

Gliflozin are very effectively used as type II diabetes. They very potent inhibit renal glucose reabsorption and inhibiting sodium-glucose transport protein2 and its called SGLT2 inhibitors. They used to enhance glycemic control as well as reduce body weight and systolic & diastolic blood pressure. They are generally administered as tablets. This review entails different methods developed for determination of the combination of Gliflozin like UV-spectroscopy and liquid chromatography

selective and potent inhibition of SGLT-2, and its activity is based on each patient’s underlying glycemic control and renal function. The results are decreased renal reabsorption of glucose, glucosuria effect increases with higher level of glucose in the blood circulation. Thereby Dapagliflozin reduces the blood glucose concentration with a mechanism that is independent of insulin secretion and sensitivity, unlike many other antidiabetic drugs. Functional β-cells are not necessary for the activity of the drug so it is convenient for patients with diminished β-cell function [2, 3].

Sodium and glucose are co-transported by the SGLT-2 protein into the tubular epithelial cells across the brush-border membrane of the proximal renal tubule. This happens because of the sodium gradient between the tubule and the cell, thereby it provides a secondary active transport of glucose. Glucose is later reabsorbed by passive transfer of endothelial cells into the interstitial glucose transporter protein. Different methods have been developed for determination of like UV-spectroscopy, liquid chromatography (HPTLC and HPLC) [2, 3].

Reported methods are categorized depending on the following considerations:
1. Single component analyzed by UV-spectroscopy methods and chromatographic method.
2. Analysis of Gliflozin from combination formulation by UV-spectroscopy methods and chromatographic method

CONCLUSION:
This review depicts the reported Spectroscopic and Chromatographic methods; developed and validated for estimation of Gliflozin class. According to this review it was concluded that for Gliflozin (Canagliflozin, Empagliflozin, and Dapagliflozin) different Spectroscopic and Chromatographic methods are available for Single component as well as for combination. Also it was found that the Mobile phase containing Acetonitrile, Water, and Phosphate buffer were common for most of the chromatographic method to provide more resolution. It was observed that most common combination of Gliflozins were with Metformin. For chromatographic method flow rate is observed in the range 0.8-1.5 ml/min to get good resolution time. For most of the Spectroscopic methods common solvent is Methanol. Hence this all methods found to be simple, accurate, economic, precise and reproducible in nature. Most of Methods were of RP-HPLC and UV absorbance detection because these methods provided with best available reliability, repeatability, analysis time and sensitivity.
